SUMMARY. In the present study, a novel coordination polymer (CP) based on Ca(II), that is, $[Ca^{II}(4\text{-HBA})(CH_3COO)(H_2O)(DMF)]_n$ (1, 4-HBA is 4-hydroxybenzoic acid, DMF is dimethyl formamide), has been generated via applying DMF as the solvent under solvothermal synthesis condition. The content of IL-18 and TNF- α inflammatory cytokines in saliva was measured with ELISA assay. Next, the real time RT-PCR was used to determine the activation of the NF- κ B in the oral mucosa epithelial cells after compound therapy.

RESUMEN. En el presente estudio, un nuevo polímero de coordinación (CP) basado en Ca(II), es decir, $[Ca^{II}(4\text{-HBA})(CH_3COO)(H_2O)(DMF)]_n$ (1, 4-HBA es 4-hidroxibenzoico ácido, DMF es dimetilformamida), se ha generado mediante la aplicación de DMF como disolvente en condiciones de síntesis solvotérmica. El contenido de citoquinas inflamatorias IL-18 y TNF- α en saliva se midió con ensayo ELISA. A continuación, se utilizó la RT-PCR en tiempo real para determinar la activación del NF- κ B en las células epiteliales de la mucosa oral después de la terapia compuesta.

KEY WORDS: coordination polymer, ELISA assay, radiation induced oral mucositis,
